- 1 Introduction
- 2 Simplicial objects
- 3 Involutive factorisation systems
- 4 Dold-Kan correspondences
- 5 Joyal's categories Θ_n

Theorem (Dold 1958, Kan 1958)

$$M : \underline{\text{Ab}}^{\Delta^{\text{op}}} \simeq \text{Ch}(\mathbb{Z}) : K$$

Corollary

There is a simplicial abelian group $K(A, n)$ such that $\pi_n(K(A, n)) = A$ and $\pi_i(K(A, n)) = 0$ for $i \neq n$.

Proof.

$K : \text{Ch}(\mathbb{Z}) \rightarrow \underline{\text{Ab}}^{\Delta^{\text{op}}}$ takes homology into homotopy. $K(A, n)$ is the image of the chain complex: $0 \leftarrow \cdots \leftarrow 0 \leftarrow \overset{n}{A} \leftarrow 0 \leftarrow \cdots$ \square

Purpose of the talk

Categorical structure of Δ inducing Dold-Kan correspondence.

Theorem (Dold 1958, Kan 1958)

$$M : \underline{\text{Ab}}^{\Delta^{\text{op}}} \simeq \text{Ch}(\mathbb{Z}) : K$$

Corollary

There is a simplicial abelian group $K(A, n)$ such that $\pi_n(K(A, n)) = A$ and $\pi_i(K(A, n)) = 0$ for $i \neq n$.

Proof.

$K : \text{Ch}(\mathbb{Z}) \rightarrow \underline{\text{Ab}}^{\Delta^{\text{op}}}$ takes homology into homotopy. $K(A, n)$ is the image of the chain complex: $0 \leftarrow \cdots \leftarrow 0 \leftarrow \overset{n}{A} \leftarrow 0 \leftarrow \cdots$ \square

Purpose of the talk

Categorical structure of Δ inducing Dold-Kan correspondence.

Definition (Involutive factorisation system)

A factorisation system $(\mathcal{E}, \mathcal{M})$ on \mathcal{C} is called *involutive* if there is a specified faithful, identity-on-objects functor $(-)^* : \mathcal{E}^{\text{op}} \rightarrow \mathcal{M}$ sth.

- (1) $ee^* = 1$ (the split idempotent e^*e is called an \mathcal{E} -projector);
- (2) the morphisms f^*e form a subcategory of \mathcal{C} ;
- (3) $\forall (A \xrightarrow{m} B) \in \mathcal{M} \forall \phi \in \text{Proj}_{\mathcal{E}}(A) \exists \psi \in \text{Proj}_{\mathcal{E}}(B) : m\phi = \psi m$;
- (4) $\text{Proj}_{\mathcal{E}}(A)$ is finite. *Primitive* \mathcal{E} -projectors can be linearly ordered such that if ϕ precedes ψ then $\psi\phi$ is an \mathcal{E} -projector.

Remark (primitive \mathcal{E} -projectors)

$\text{Proj}_{\mathcal{E}}(A) \cong \text{Quot}_{\mathcal{E}}(A)$. Primitive \mathcal{E} -projectors are *covered* by 1_A .

Remark (Involutive factorisation system for Δ)

Each epi $e : [m] \twoheadrightarrow [n]$ has a *maximal* section $e^* : [n] \rightarrow [m]$.

The primitive \mathcal{E} -projectors of $[n]$ are the $\eta_i^* \eta_i = \epsilon_i \eta_i$, $0 \leq i \leq n$.

Definition (Involutive factorisation system)

A factorisation system $(\mathcal{E}, \mathcal{M})$ on \mathcal{C} is called *involutive* if there is a specified faithful, identity-on-objects functor $(-)^* : \mathcal{E}^{\text{op}} \rightarrow \mathcal{M}$ sth.

Theorem (generalised Dold-Kan correspondence, BCW 2019)

For each category \mathcal{C} with involutive factorisation system $(\mathcal{E}, \mathcal{M})$ and each abelian category \mathcal{A} there is an adjoint equivalence

$$M_{\mathcal{C}} : [\mathcal{C}^{\text{op}}, \mathcal{A}] \simeq [\Xi_{\mathcal{C}}^{\text{op}}, \mathcal{A}]_* : K_{\mathcal{C}}$$

Remark (constructing $M_{\mathcal{C}}$ and $K_{\mathcal{C}}$ for general \mathcal{C})

Denote $j : \mathcal{M} \hookrightarrow \mathcal{C}$ and $q : \mathcal{M} \rightarrow \Xi_{\mathcal{C}} = \mathcal{M}/\mathcal{M}_{\text{iness}}$. Then

$$M_{\mathcal{C}} : [\mathcal{C}^{\text{op}}, \mathcal{A}] \begin{array}{c} \xrightarrow{j^*} \\ \xleftarrow{j} \end{array} [\mathcal{M}^{\text{op}}, \mathcal{A}] \begin{array}{c} \xrightarrow{q_*} \\ \xleftarrow{q^*} \end{array} [\Xi_{\mathcal{C}}^{\text{op}}, \mathcal{A}]_* : K_{\mathcal{C}}$$

Examples

- Γ (Pirashvili 2000) and Flq (Ellenberg-Church-Farb 2015)
- Ω_{planar} (Gutierrez-Lukasec-Weiss 2011) and Ω (Bacik-Moerdijk)
- similar approaches (Helmstutler 2014 and Lack-Street 2015)

$$N_{\Theta_n} : n\text{Cat} \rightarrow \text{Sets}^{\Theta_n^{\text{op}}}$$

Definition (elegant Reedy category=skeletal EZ-category)

A *Reedy category* \mathcal{C} has a strict $(\mathcal{E}, \mathcal{M})$ -factorisation system, a grading $\text{deg} : \text{Ob}\mathcal{C} \rightarrow \mathbb{N}$ such that \mathcal{E} (resp. \mathcal{M})-maps lower (resp. increase) degree. \mathcal{C} is *elegant* if \mathcal{E} has absolute pushouts.

Lemma (generalised Eilenberg-Zilber)

For any presheaf $X : \mathcal{C}^{\text{op}} \rightarrow \text{Sets}$, each $x \in X(c)$ equals $X(\phi)(y)$ for unique $\phi : c \rightarrow d$ in \mathcal{E} and “non-degenerate” $y \in X(d)$.

Proposition (Bergner-Rezk 2017)

If \mathcal{A} is an elegant Reedy category then so is $\Delta \wr \mathcal{A}$.
In particular, Θ_n is an elegant Reedy category.

Proposition (BCW 2019)

If \mathcal{A} has an involutive Reedy factorisation then so has $\Delta \wr \mathcal{A}$.
In particular, Θ_n has an involutive factorisation system.

Theorem (BCW 2019)

$$\underline{\text{Ab}}^{\Theta_n^{\text{op}}} \simeq [\Xi_{\Theta_n}^{\text{op}}, \underline{\text{Ab}}]_*$$

Remark (Θ_n -set model for Eilenberg-MacLane spaces)

- For each abelian group A there is an abelian group object $B^n A$ in $n\text{Cat}$ with one k -cell for $0 \leq k < n$;
- $|N_{\Theta_n}(B^n A)|$ is a cellular model for $K(A, n)$
- Its cellular chain complex is the “totalisation” of corresponding $\Xi_{\Theta_n}^{\text{op}}$ -complex.

Example (cells of $K(\mathbb{Z}/2\mathbb{Z}, n)$ for $n = 1, 2, 3$)

# cells in dim	0	1	2	3	4	5	6	7	8	9
$K(\mathbb{Z}/2\mathbb{Z}, 1)$	1	1	1	1	1	1	1	1	1	1
$K(\mathbb{Z}/2\mathbb{Z}, 2)$	1	0	1	1	2	3	5	8	13	21
$K(\mathbb{Z}/2\mathbb{Z}, 3)$	1	0	0	1	1	2	4	7	13	24

Theorem (BCW 2019)

$$\underline{\text{Ab}}^{\Theta_n^{\text{op}}} \simeq [\Xi_{\Theta_n}^{\text{op}}, \underline{\text{Ab}}]_*$$
